## Successful Planting The G3 Way

- Dig hole depth of rootball (no more) and any width.
- (N) completely each time Fill hole with water TWICE, allowing it to drain
- (W) soluble humate. Allow all air bubbles to escape. Submerge plant rootball (in or out of container) in bucket of water with fish hydrolosate or water

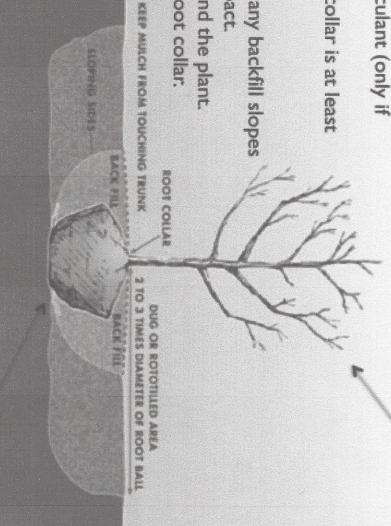

by it's branches and leaves!

Never grab a plant

Dust rootball with mycorrhizae inoculant (only if

mycorrhizal plant; not for grasses).

- (5) Place plant in hole. Make sure root collar is at least 1/2" - I" above existing grade.
- 6 Fill with water and allow to drain
- away from the collar. Tamp to compact Backfill with native soil making sure any backfill slopes
- Do not create a bowl or berm around the plant
- 6 Mulch 4" - 6" to within 2" - 3" of root collar.
- Water area thoroughly.

Always support a plant by it's rootball.
